Buffnstaff's Intelligent Software

The quality of software depends upon the intelligence packed into it. The software thinks artificially on your behalf in carrying out your work with full function and efficiency. In determining a software's artificial intelligence, or intelligence in general, the first question to be addressed is whether thinking is an intelligent activity at all, given the widespread confusion that "All thought is illusion". We prove first that this belief of illusion or maya is false.

Consider the following two axioms:

Axiom 1. Truth is true.

Axiom 2. Maya is true.

A system with the first axiom/belief is self-consistent as the axiom admits itself as a part of truth.

A system with the second axiom/belief contradicts itself as the axiom itself becomes maya/illusion or false. The second belief denies truth and in doing so also denies its own validity. Hence someone positing the second belief is essentially a denier of truth and proposer of falsehoods and frankly has no grounds to stand upon since his own basis stands undermined.

B. R. Ambedkar, with remarkable foresight, moved past Krishna and renounced him as one of his last acts. But why renounce Ram, since for Ram, we have "Raghukul reeti sada chali aayi, praan jayi, par vachan na jayi".

In layman's terms if the belief that "All thought is illusion" is true, then since the belief itself is a thought, it becomes an illusion and hence false.   Any treatise attempting to push such a belief is therefore a fraud, since the belief is self-contradictory.

A follower of the maya belief is then naïve or gullible at the very least, since he rests on the non-credible. A guru or teacher of the maya treatise is then a fraudster at the very least, since he sells the non-credible. If a guru actually believes what he preaches, then he manifests both gullibility and con-artistry simultaneously, indicating a split personality of the lunatic type.

Indians were noted by Alexander, an early visitor, for their immense self-confidence. Gurus, above would easily manifest such confidence. The latest visitors, the British dealt with thugs early on by outlawing thugee, but neither survived for long in the Indian environment. The longstanding visitors who actually made India their domicile were Muslims, but they kept themselves apart by their strict religious practices.

Coming back to software, once thinking is accepted as an intelligent activity, then delegated activity, the computer "thinking" on your behalf, also becomes an "intelligent" activity. Buffnstaff's software, downloadable at www.buffnstaff.com is the world's best in its own category, both function-wise and efficiency-wise (speed-wise).
